# River Quaggy: Lewisham

Salix provided Coir Rolls and Coir Pallets to provide instant vegetation and habitat on the deculverted River Quaggy, alongside being involved in the construction of in-channel features to help restore the River in Lewisham.

The River Quaggy is classified as a chalk stream. However, urbanisation has significantly degraded the watercourse within London.

The confluence between the River Quaggy and the River Ravensbourne was historically culverted, but recent development has led to the deculverting of the watercourses and the confluence.

**Salix**

Salix installed Coir Rolls and Coir Pallets to provide instant vegetation and habitat in spring, 2019.

Since installation, vegetation has established well to provide excellent habitat. The area provides a vital refuge for wildlife as the watercourse is culverted both upstream and downstream.

Revisiting the site:

We went back in 2022 to see how the project had fared and were delighted to see that the wetland is rich with a diverse range of plant species, and roach and smaller fry were also visible in the river.
